CYBERSECURITY AT SCALE - BEST OF BREED VS. STANDARDIZATION

July 17, 2024
5:30 PM-9:00 PM

Central Time

For over a decade, security leaders and architects utilized a disparate best of breed point solution framework to solve their security challenges. This resulted in bloated security architectures, overlap in capabilities and significant security architecture and integration failures. These failures impacted organization's ability to scale to meet business demands and reduced stability of the security architecture as environments and data volumes grew. The use of AI driven detections, automation, endpoint security, attack surface management and real-time threat intelligence application were the moonshot achievements for security solutions like SIEM, but were never achieved. Join this session to discuss: Scaling to meet business demands and stabilizing your security architecture Reimagining organizational security operations programs based on standardization Achieving the impossible with security information and event management
